

Forest Resources of the United States, 2012

Abstract

Oswalt, Sonja N.; Smith, W. Brad; Miles, Patrick D.; Pugh, Scott A. 2014. Forest Resources of the United States, 2012. Gen. Tech. Rep. WO-xxx. Washington, DC: U.S. Department of Agriculture, Forest Service, Washington Office. xxx p. (*in preparation*)

Forest resource statistics from the 2010 Resources Planning Act (RPA) Assessment were updated to provide current information on the Nation's forests as a baseline for the 2015 national assessment. Resource tables present estimates of forest area, volume, mortality, growth, removals, and timber products output in various ways, such as by ownership, region, or State. Current resource data and trends are analyzed and placed within the context of changes since 1953. Additional analyses look at the resource from an ecological, health, and productivity perspective. An interactive RPA Data Wiz CD is also included to provide user access to the resource data.

Keywords: RPA, assessment, inventory, forest statistics, area, volume, productivity

NOTE:

The draft tables presented here will form the basis for the 2015 RPA Assessment Update of the status and trends in the nation's forests. Previous releases of these tables have been the basis of significant natural resource policy decisions. Therefore, it is deemed important to provide public notice of the opportunity for review and comment of these tables prior to their publication. For further information contact Sonja Oswalt at 865-862-2058 (soswalt@fs.fed.us) or W. Brad Smith at 703-605-4177 (bsmith12@fs.fed.us).

Data in the tables presented here are Preliminary and Not for Publication or Distribution without permission of the authors.

RPA 2012 revised definitions and footnotes

forest land—Land at least 120 feet (37 meters) wide and at least 1 acre (0.5 hectare) in size with at least 10 percent cover (or equivalent stocking) by live trees including land that formerly had such tree cover and that will be naturally or artificially regenerated. Trees are woody plants having a more or less erect perennial stem(s) capable of achieving at least 3 inches (7.6 cm) in diameter at breast height, or 5 inches (12.7 cm) diameter at root collar, and a height of 16.4 feet (5 meters) at maturity *in situ*. The definition here includes all areas recently having such conditions and currently regenerating or capable of attaining such condition in the near future. Forest land also includes transition zones, such as areas between forest and nonforest lands that have at least 10 percent cover (or equivalent stocking) with live trees and forest areas adjacent to urban and built-up lands. Unimproved roads and trails, streams, and clearings in forest areas are classified as forest if they are less than 120 feet (37 meters) wide or an acre in size. Forest land does not include land that is predominantly under agricultural or urban land use.

other wooded land - Land at least 120 feet (37 meters) wide and at least 1 acre (0.5 hectares) in size with sparse trees capable of achieving 16.4 feet (5 meters) in height with a tree canopy cover of 5-10 percent combined with shrubs a least 6 feet (2 meters) in height to achieve an overall cover of greater than 10% of woody vegetation. Trees are woody plants having a more or less erect perennial stem(s) capable of achieving at least 3 inches (7.6 cm) in diameter at breast height, or 5 inches (12.7 cm) diameter at root collar, and a height of 16.4 feet (5 meters) at maturity *in situ*. The definition here includes all areas recently having such conditions and currently regenerating or capable of attaining such condition in the near future. It does not include land that is predominantly under agricultural or urban land use.

Additional notes:

historic forest area data by state (Table 3) - changes have been made to historic forest area estimates for states in the interior west, including Texas and Oklahoma. These changes are estimates and intended to correct historic data for reclassification of some forest land to other wooded land and provide consistent time series information.

other wooded land footnote - Other wooded land is a class of land which consists predominantly of stands of sparse woodland species such as juniper, pinyon juniper, mesquite and small stature hardwood species and are found in the arid to semi-arid regions of the interior western United States. These areas must span more than 1 acre (0.5 hectares), have sparse trees capable of achieving 16.4 feet (5 meters) in height *in situ*, and a tree canopy cover of 5-10 percent. When combined with shrubs and bushes these areas may achieve overall cover greater than 10% woody vegetation. Trees are defined as woody plants having a more or less erect perennial stem(s) capable of achieving at least 3 inches (7.6 cm) in diameter at breast height, or 5 inches (12.7 cm) diameter at root collar, and a height of 16.4 feet (5 meters) at maturity *in situ*. These areas do not include land that is predominantly under agricultural or urban land use. For some local analysis these lands might be called scrub forest but the preferred terminology is "Forest and Other Wooded Land" when adding these areas to forest totals. Table 1b provides the proper usage of this nomenclature.

Comparing 2012 RPA data to FIADB - due to the new classification of "other wooded land", data comparisons for forest land between this report and FIADB will not match for the interior western states including Texas and Oklahoma. Table 1b in this report showing the total for "Forest and Other Wooded Land" will be the same as forest land in the FIADB. Timberland estimates in all regions are not affected.

Tables 52 through 55 - New data unavailable, data remains the same as published in the 2007 Report. Data are provided here for reference.

Data in the tables presented here are Preliminary and Not for Publication or Distribution without permission of the authors.

LIST OF TABLES

Data in the tables presented here are Preliminary and Not for Publication or Distribution without permission of the authors.

^b Other wooded land is a class of land which consists predominantly of stands of sparse woodland species such as juniper, pinyon juniper, mesquite and small stature hardwood species and are found in the arid to semi-arid regions of the interior western United States. These areas must span more than 1 acre (0.5 hectares), have sparse trees capable of achieving 16.4 feet (5 meters) in height in situ, and a tree canopy cover of 5-10 percent. When combined with shrubs and bushes these areas may achieve overall cover greater than 10% woody vegetation. Trees are defined as woody plants having a more or less erect perennial stem(s) capable of achieving at least 3 inches (7.6 cm) in diameter at breast height, or 5 inches (12.7 cm) diameter at root collar, and a height of 16.4 feet (5 meters) at maturity in situ. These areas do not include land that is predominantly under agricultural or urban land use. For some local analysis these lands might be called scrub forest but the preferred terminology is "Forest and Other Wooded Land" when referring to these combined areas. The values in this column do not currently include qualifying areas that are predominantly shrub species only and large areas of chaparral.

^c Maryland total land area includes 39,298 acres in District of Columbia.

^d The forest areas of Texas and Oklahoma are significantly higher than reported in previous national assessments. This is due to the non-timberland forests in the western portions of these States being estimated by FIA for the first time. The RPA forest area estimates for Texas and Oklahoma are significantly lower than reported by FIA due to differences between FIA and RPA definitions of forest land. The difference between RPA and FIA forest estimates is found in the "other wooded land" column of this table.

Note: Data may not add to totals because of rounding.

^a Other wooded land is a class of land which consists predominantly of stands of sparse woodland species such as juniper, pinyon juniper, mesquite and small stature hardwood species and are found in the arid to semi-arid regions of the interior western United States. These areas must span more than 1 acre (0.5 hectares), have sparse trees capable of achieving 16.4 feet (5 meters) in height in situ, and a tree canopy cover of 5-10 percent. When combined with shrubs and bushes these areas may achieve overall cover greater than 10% woody vegetation. Trees are defined as woody plants having a more or less erect perennial stem(s) capable of achieving at least 3 inches (7.6 cm) in diameter at breast height, or 5 inches (12.7 cm) diameter at root collar, and a height of 16.4 feet (5 meters) at maturity in situ. These areas do not include land that is predominantly under agricultural or urban land use. For some local analysis these lands might be called scrub forest but the preferred terminology is "Forest and Other Wooded Land" when referring to these combined areas. The values in this column do not currently include qualifying areas that are predominantly shrub species only and large areas of chaparral.

^b The forest areas of Texas and Oklahoma are significantly higher than reported in previous national assessments. This is due to the non-timberland forests in the western portions of these States being estimated by FIA for the first time. The RPA forest area estimates for Texas and Oklahoma are significantly lower than reported by FIA due to differences between FIA and RPA definitions of forest land. The difference between RPA and FIA forest estimates is found in the "other wooded land" column of this table.

Note: Data may not add to totals because of rounding.

^a It is no longer possible to classify private forest as forest industry and nonindustrial private due to disclosure issues. The new classes are private corporate and non-corporate. Native American lands are included in private non-corporate.

Note: Data may not add to totals because of rounding.

^a Estimates for 1630, 1907 and 1938 include forest area for regions that would become the 50 States within the current United States. Estimates for 2007 and historic years have been adjusted for forest definition change to minimum 10% cover and removal of chaparral as a forest type- refer to 1997 RPA tables for historic estimates prior to this change.

^b Data for 1909- 1997 adjusted for removal of chaparral type and addition of historic west Texas and west Oklahoma unproductive forest.

^c Data for 1630 were also from Kellogg (1909) as an estimate of the original forest area based on the current estimate of forest and historic land clearing information. These data are provided here for general reference purposes only to convey the relative extent of the forest estate, in what is now the United States, at the time of European settlement.

Note: Data may not add to totals because of rounding.

^a Productivity classes are displayed as cubic feet per acre per year.

^b Other wooded land is a class of land which consists predominantly of stands of sparse woodland species such as juniper, pinyon juniper, mesquite and small stature hardwood species and are found in the arid to semi-arid regions of the interior western United States. These areas must span more than 1 acre (0.5 hectares), have sparse trees capable of achieving 16.4 feet (5 meters) in height in situ, and a tree canopy cover of 5-10 percent. When combined with shrubs and bushes these areas may achieve overall cover greater than 10% woody vegetation. Trees are defined as woody plants having a more or less erect perennial stem(s) capable of achieving at least 3 inches (7.6 cm) in diameter at breast height, or 5 inches (12.7 cm) diameter at root collar, and a height of 16.4 feet (5 meters) at maturity in situ. These areas do not include land that is predominantly under agricultural or urban land use. For some local analysis these lands might be called scrub forest but the preferred terminology is "Forest and Other Wooded Land" when adding these areas to forest totals.

Note: Data may not add to totals because of rounding.

^a Productivity classes are displayed as cubic feet per acre per year.

^b Other wooded land is a class of land which consists predominantly of stands of sparse woodland species such as juniper, pinyon juniper, mesquite and small stature hardwood species and are found in the arid to semi-arid regions of the interior western United States. These areas must span more than 1 acre (0.5 hectares), have sparse trees capable of achieving 16.4 feet (5 meters) in height in situ, and a tree canopy cover of 5-10 percent. When combined with shrubs and bushes these areas may achieve overall cover greater than 10% woody vegetation. Trees are defined as woody plants having a more or less erect perennial stem(s) capable of achieving at least 3 inches (7.6 cm) in diameter at breast height, or 5 inches (12.7 cm) diameter at root collar, and a height of 16.4 feet (5 meters) at maturity in situ. These areas do not include land that is predominantly under agricultural or urban land use. For some local analysis these lands might be called scrub forest but the preferred terminology is "Forest and Other Wooded Land" when adding these areas to forest totals.

Note: Data may not add to totals because of rounding.

^a Productivity classes are displayed as cubic feet per acre per year.

^b Other wooded land is a class of land which consists predominantly of stands of sparse woodland species such as juniper, pinyon juniper, mesquite and small stature hardwood species and are found in the arid to semi-arid regions of the interior western United States. These areas must span more than 1 acre (0.5 hectares), have sparse trees capable of achieving 16.4 feet (5 meters) in height in situ, and a tree canopy cover of 5-10 percent. When combined with shrubs and bushes these areas may achieve overall cover greater than 10% woody vegetation. Trees are defined as woody plants having a more or less erect perennial stem(s) capable of achieving at least 3 inches (7.6 cm) in diameter at breast height, or 5 inches (12.7 cm) diameter at root collar, and a height of 16.4 feet (5 meters) at maturity in situ. These areas do not include land that is predominantly under agricultural or urban land use. For some local analysis these lands might be called scrub forest but the preferred terminology is "Forest and Other Wooded Land" when adding these areas to forest totals.

Note: Data may not add to totals because of rounding.

^a Undetermined stands are predominantly in reserved and low productivity forests that currently do not have field data to establish average d.b.h.

^b Other wooded land is a class of land which consists predominantly of stands of sparse woodland species such as juniper, pinyon juniper, mesquite and small stature hardwood species and are found in the arid to semi-arid regions of the interior western United States. These areas must span more than 1 acre (0.5 hectares), have sparse trees capable of achieving 16.4 feet (5 meters) in height in situ, and a tree canopy cover of 5-10 percent. When combined with shrubs and bushes these areas may achieve overall cover greater than 10% woody vegetation. Trees are defined as woody plants having a more or less erect perennial stem(s) capable of achieving at least 3 inches (7.6 cm) in diameter at breast height, or 5 inches (12.7 cm) diameter at root collar, and a height of 16.4 feet (5 meters) at maturity in situ. These areas do not include land that is predominantly under agricultural or urban land use. For some local analysis these lands might be called scrub forest but the preferred terminology is "Forest and Other Wooded Land" when adding these areas to forest totals.

Note: Data may not add to totals because of rounding.

^a Growing-stock volume cut or knocked down during harvest but left at the harvest site.

^b Wood volume other than growing stock cut or knocked down during harvest but left on the ground. This volume is net of wet rot or advanced dry rot, and excludes old punky logs; consists of material sound enough to chip; includes downed dead and cull trees, tops above the 4-inch growing-stock top, and smaller than 5 inches d.b.h.; excludes stumps and limbs.

^c Growing-stock volume removed by cultural operations or timberland clearing.

^d Wood volume other than growing stock removed by cultural operations or timberland clearing. This volume is net of wet rot or advanced dry rot, and excludes old punky logs; consists of material sound enough to chip; includes downed dead and cull trees, tops above the 4-inch growing-stock top, and smaller than 5 inches dbh; excludes stumps and limbs.

Note: Data may not add to totals because of rounding.
